

Drive solutions for pool covers

Mastering challenging environmental conditions
with Becker.

BECKER
Together it's easier.

Our drive combines safety and comfort

It is a well-known fact that pool covers reach high weights and thus place axial loads on the drive. To ensure durability, drives for pool covers from Becker are equipped with reinforcements on the drive. To be more precise, our 24 V DC drives have a reinforced motor head. Among other things, they develop enormous power due to their low speed, which can effortlessly move your pool cover.

But it is precisely in this area that the question arises how an interaction between an electronic operating instrument and water is possible. That is why our drives have an IP55 classification, which ensures that our electrical operating instruments are permissibly protected against external influences and water jets.

EXTENDED
applications

Special motor head

Force-fitted reinforcements to absorb high axial loads

Protected against water jets

Increased protection against the ingress of water

**12V
DC**

**24V
DC**

Safety extra-low voltage

DC power supply for protection against electric shock
